

## **Traffic Pirate Bot**

THANK YOU FOR PURCHASING THIS TOOL. IF YOU HAVE ANY QUESTIONS YOU CAN REACH ME ON TELEGRAM @TP-Dev

- Double click on the 'TrafficBotStartup1" file to set up dependancies and start the bot.
- Once the main menu appears the rest is self explanatory.
- Just follow the GUI prompts and fill out the input information.
- Click 'Deploy' to start the bot live.
- (OR)
- Click 'Debug' to start the bot in a local environment for testing. (this is only needed when submitting a pull request)

### **{Tip}**

- Make sure you do NOT include '@' in your snap username.
- The bot uses a free API library written by me to utilize rotating proxies scraped with another bot I have hosted in the cloud. When the bot calls this library, the function may be blocked by windows or you may get a notification that has a 'Run Anyway' option. If you don't see that try 'More Info' then 'Run Anyway'

**When the menu asks, you'll need to enter your;**

- Email list or email API.
- Phone number list, or API.
- If you choose not to use the free proxies you'll have an opportunity to input your proxy list.
- Also you will need a CAPTCHA API or HCAPTCHA API depending on what platform you'll be automating.

At the time of this writing this bot currently supports;

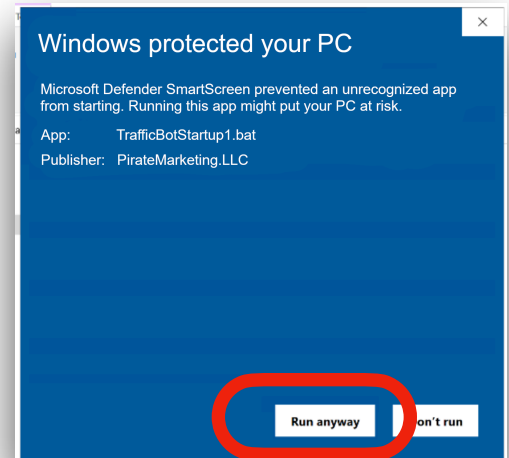

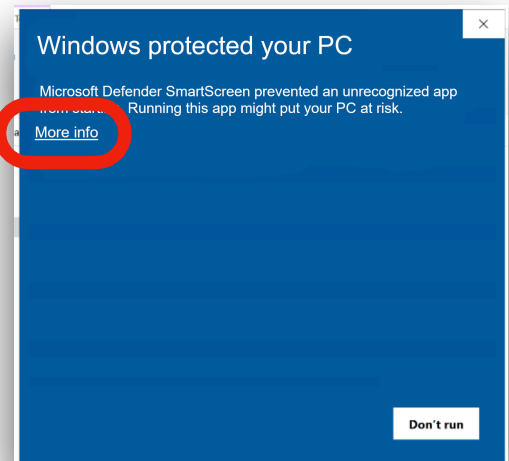

-Tinder  
-Bumble

---

-Badoo  
-OKCupid  
-Plenty of Fish  
-Reddit  
-Twitter

*More platforms will be added as the beta process proceeds.  
likewise some platforms will likely be removed due to patches.*

***If your antivirus blocks the download or script like windows defender sometimes does, you'll need to turn off the antivirus while you set up the bot. The method that I use to scrape the proxies for you seems to trigger a couple different anti-viruses with a false positive. It'll work fine once you either create an exclusion for the directory you're downloading the zip file into, or just turning off "real-time monitoring" temporarily.***

*Happy Pirating!*
